

5      **TITLE OF THE INVENTION**

**CLEAR VIEW CANNULA**

10

**Abstract of the Disclosure**

15            There is disclosed a clear view cannula for use in surgical procedures having  
a tubular body, a cylindrical sleeve mounted about and slidably secured to the  
tubular body, and a plurality of shield members secured to the cylindrical sleeve.  
The cylindrical sleeve is slidably movable relative to the tubular body causing the  
shield members to expand and deploy such that the shield members retain torn and  
20            fragmented soft tissue within an anatomical cavity. Means are provided on the  
tubular body to co-act with means on the cylindrical sleeve to lock the expanded  
and deployed shield members and secure the tubular body within an anatomical  
body.
